

# REVERSE TOTAL SHOULDER ARTHROPLASTY CLINICAL PRACTICE GUIDELINES

## **Background**

Reverse total shoulder arthroplasty is indicated for patients who have continued pain and loss of function in the presence of advanced joint pathology and have failed conservative measures. The procedure involves replacing the head of the humerus and resurfacing the glenoid fossa while switching their positions in the shoulder. Care should be taken in regards to management of the subscapularis post operatively due to the subscapularis takedown procedure performed.

## **Disclaimer**

Progression is time and criterion-based, dependent on soft tissue healing, patient demographics and clinician evaluation. If patient desires to return to sports, a prior conversation with physician is required as well as physician clearance to begin return to sport criteria. Return to sport likely only appropriate for previously active individuals. Low impact activities are the most appropriate, while activities that require higher demand of the upper extremity or come with a fall risk are less appropriate. If you are working with an Ohio State Sports Medicine patient and questions arise, please contact the author by calling our office at (614) 293-2385.

## Summary of Recommendations

<p><b>Precautions</b></p>	<ul style="list-style-type: none"> <li>• Sling use for 4-6 weeks</li> <li>• No internal rotation, cross body adduction, or extension x 12 weeks (Hand Behind Back Position)</li> <li>• Forward elevation in SCAPTION only for 4-6 weeks (rTSA is in most stable position at 30 deg ER)</li> <li>• No forced shoulder Flexion</li> <li>• No stretching into pain</li> <li>• Caution with end range motion – Do NOT push hard into end ranges</li> <li>• No supporting of body weight by hand on involved side (for example, pushing up from a chair) x 12 weeks</li> <li>• No driving for six weeks</li> <li>• Jogging may begin at 12 weeks</li> <li>• Long Term:             <ul style="list-style-type: none"> <li>○ No push-ups or bench press</li> <li>○ 15lb limit below shoulder height</li> <li>○ 10lb limit above shoulder height</li> </ul> </li> <li>• Subscapularis Precautions (Confirm with Surgeon)             <ul style="list-style-type: none"> <li>○ No ER PROM past neutral for 4 weeks</li> <li>○ No Active IR for 8 weeks</li> </ul> </li> </ul> <p><i>Check with surgeon's office if posterior instability precautions are indicated on referral or operative report</i></p>
<p><b>Outcome Tools</b></p>	<ul style="list-style-type: none"> <li>• Quick DASH</li> <li>• Simple Shoulder Test</li> <li>• American Shoulder and Elbow Surgeon's Shoulder Evaluation Short Form</li> </ul>
<p><b>Discharge Sling</b></p>	<ul style="list-style-type: none"> <li>• 4-6 weeks based on surgeon recommendation</li> </ul>
<p><b>Criteria to Initiate Plyometrics</b></p>	<ul style="list-style-type: none"> <li>• Within functional active shoulder ROM</li> <li>• Time: no earlier than 16 weeks</li> <li>• Pain-free ADL's and strengthening interventions</li> <li>• Proper scapular control during interventions</li> <li>• Strength 5/5 MMT and/or &gt;90% of uninjured shoulder with scapular musculature</li> </ul>
<p><b>Criteria for Return to Sport</b></p>	<ul style="list-style-type: none"> <li>• Patient is pain free with all ADLs and all rehab interventions</li> <li>• Completion of strengthening phase and plyometric phase</li> <li>• Strength 5/5 MMT or &gt;90% of uninjured shoulder with scapular musculature</li> <li>• Can begin at six months post-operatively with physician clearance</li> <li>• Most common sports to return: Swimming, Fitness, Golf, tennis, pickleball</li> </ul>
<p><b>Criteria for Discharge</b></p>	<ul style="list-style-type: none"> <li>• Patient is able to maintain pain-free shoulder AROM (typically 110-150° of elevation, with functional ER of about 30-50°)</li> <li>• Patient demonstrates proper shoulder mechanics</li> <li>• Patient has 4/5 MMT strength if returning to normal iADL's, 5/5 if returning to sport</li> </ul>

### Phase I: Post-operative – 2 weeks

- Continue home program including wrist/hand, pendulums, and shoulder blade squeezes

### Phase II: Weeks 2-4

<b>ROM</b>	<ul style="list-style-type: none"><li>• Continue all exercises as above</li><li>• Frequent cryotherapy application – 4-5 times a day for 15 to 20 minutes</li><li>• NO SHOULDER IR, ADDUCTION, EXTENSION OR CROSS BODY MOVEMENT</li></ul>
<b>Strengthening</b>	<ul style="list-style-type: none"><li>• Begin submaximal pain-free deltoid isometrics in scapular plane (avoid shoulder extension when isolating posterior deltoid)</li></ul>
<b>Goals to progress to Next Phase</b>	<ul style="list-style-type: none"><li>• Enhance PROM</li><li>• Restore active range of motion (AroM) of elbow/wrist/hand</li><li>• Independent with activities of daily living (ADLs) with modifications</li></ul>

### Phase III: Weeks 4-6

<b>ROM</b>	<ul style="list-style-type: none"><li>• Progress PROM</li><li>• Forward scaption in supine to 120°</li><li>• ER in scapular plane to tolerance, respecting soft tissue constraints (30-45°)</li><li>• Continue frequent cryotherapy</li><li>• NO SHOULDER IR, ADDUCTION OR CROSS BODY MOVEMENT</li></ul>
<b>Strength</b>	<ul style="list-style-type: none"><li>• Gentle resisted exercise of elbow, wrist, and hand</li><li>• Discontinue use of sling at six weeks</li></ul>
<b>Goals to Progress to Next Phase</b>	<ul style="list-style-type: none"><li>• Patient tolerates shoulder PROM as outlined above</li><li>• Patient tolerates elbow, wrist and hand AROM</li><li>• Patient demonstrates the ability to isometrically activate all components of the deltoid and periscapular musculature in the scapular plane</li></ul>

## Phase IV: Weeks 6-10

<b>Precautions</b>	<ul style="list-style-type: none"><li>• Continue to avoid shoulder hyperextension</li><li>• In the presence of poor shoulder mechanics avoid repetitive shoulder AROM exercises/activity</li><li>• Progressively work into flexion-based exercises but DO NOT FORCE</li><li>• Restrict lifting of objects to no heavier than a coffee cup</li><li>• No supporting of body weight by involved upper extremity</li></ul>
<b>ROM</b>	<ul style="list-style-type: none"><li>• Begin shoulder active assisted ROM/AROM progressing from supine to seated as tolerated in scaption and ER in the scapular plane</li><li>• Gentle glenohumeral and scapulothoracic joint mobilizations as indicated (Grades I and II)</li><li>• Patient may begin to use hand of involved extremity for feeding and light ADLs</li><li>• Continue use of cryotherapy as needed</li><li>• NO SHOULDER IR, ADDUCTION, EXTENSION OR CROSS BODY MOVEMENT</li></ul>
<b>Strength</b>	<ul style="list-style-type: none"><li>• Progress strengthening of elbow, wrist, and hand</li><li>• Begin gentle glenohumeral ER submaximal pain-free isometrics</li><li>• Initiate gentle scapulothoracic rhythmic stabilization and alternating isometrics in supine as appropriate.</li><li>• Begin gentle periscapular and deltoid submaximal pain-free isotonic strengthening exercises, typically toward the end of the eighth week (Emphasis on high reps with low resistance)</li></ul>
<b>Goals to progress to Next Phase</b>	<ul style="list-style-type: none"><li>• Continue progression fo PROM</li><li>• Gradually restore AROM</li><li>• Control pain and inflammation</li><li>• Re-establish dynamic shoulder stability</li></ul>

## Phase V: Weeks 10-12

<b>ROM</b>	<ul style="list-style-type: none"> <li>Continue with above exercises and functional activity progression</li> <li>NO SHOULDER IR, ADDUCTION OR CROSS BODY MOVEMENT</li> </ul>
<b>Strength</b>	<ul style="list-style-type: none"> <li>Begin supine forward flexion scaption with light weights of 1-3 pounds at varying degrees of trunk elevation as appropriate (ie, supine to sitting/standing)</li> <li>Progress to gentle glenohumeral ER isotonic strengthening exercises</li> </ul>
<b>Goals to Progress to Next Phase</b>	<ul style="list-style-type: none"> <li>Improving function of shoulder</li> <li>Patient demonstrates the ability to isotonicly activate all components of the deltoid and periscapular musculature and is gaining strength</li> </ul>

## Phase VI: Weeks 12+

<b>Precautions</b>	<ul style="list-style-type: none"> <li>No lifting of objects heavier than six-ten pounds with the operative upper extremity</li> <li>No sudden lifting or pushing activities</li> </ul>
<b>ROM</b>	<ul style="list-style-type: none"> <li>Continue to maintain gains</li> <li>Begin progressing IR as tolerated</li> <li>Begin progressing horizontal adduction as tolerated</li> </ul>
<b>Strength</b>	<ul style="list-style-type: none"> <li>Continue with the previous program as indicated</li> <li>Progress to gentle resisted flexion, elevation in standing as appropriate</li> <li>Typically the patient is on a HEP at this stage, to be performed 3-4 times per week, with the focus on:             <ul style="list-style-type: none"> <li>Continued strength gains focusing on upper trapezius, latissimus dorsi and posterior deltoid</li> <li>Continued progression toward a return to functional and recreational activities within limits, as identified by progress made during rehabilitation and outlined by surgeon and physical therapist</li> </ul> </li> </ul>
<b>Goals to Progress to next phase if appropriate</b>	<ul style="list-style-type: none"> <li>Patient is able to maintain pain-free shoulder AROM (typically 110° -150° of elevation, with functional ER of about 30-50°)</li> <li>Patient demonstrates proper shoulder mechanics</li> <li>Patient demonstrates at least 90% on uninvolved shoulder scapular musculature strength tested via handheld dynamometry</li> <li>Patient has received physician clearance</li> </ul>

## Phase VII: Weeks 16+ (Goal is to return to sport at 6 months)

<b>Precautions</b>	<ul style="list-style-type: none"><li>• PHYSICIAN CLEARANCE TO BEGIN</li><li>• No lifting greater than 15 lbs below shoulder height and 10 lb above shoulder height</li><li>• Do not overload internal rotation or cross body horizontal adduction</li></ul>
<b>ROM</b>	<ul style="list-style-type: none"><li>• Patient should have close to their maximum range of motion at this time</li><li>• Continue to maintain gains with IR as tolerated</li></ul>
<b>Strength</b>	<ul style="list-style-type: none"><li>• Continue with progressive strengthening</li><li>• Progress resisted rotational movements and cross body adduction</li><li>• Begin perturbations in various degrees and planes</li></ul>
<b>Sport Specifics</b>	<ul style="list-style-type: none"><li>• Begin increasing speed of movement</li><li>• Double hand plyometrics first (typically starting with under six pounds)</li><li>• Typically should take at least three weeks to progress through double arm plyometrics before progressing to single arm plyometrics</li><li>• Incorporate sport specific movement patterns</li></ul>
<b>Criteria for Discharge form Physical Therapy</b>	<ul style="list-style-type: none"><li>• Patient is able to maintain pain free shoulder AROM (typically 110°-150° of elevation, with functional ER of about 30°-50°)</li><li>• Patient demonstrates proper shoulder mechanics</li><li>• Patient has 5/5 strength and/or &gt;90% of the uninvolved scapular musculature strength</li></ul>
