Thank you for your interest in our study investigating how males share genetic health information surrounding Hereditary Breast and Ovarian Cancer (HBOC). If you are an English-speaking male over the age of 18 and have a BRCA gene mutation and/or have family members with a BRCA gene mutation, you are eligible to participate in this study, titled “Motivations for Males Affected by Hereditary Breast and Ovarian Cancer to Disclose Genetic Health Information”.

The study involves a phone interview that will take approximately 30 minutes to complete, and participants will receive a $15 Target gift card.

The main purpose of this study is to examine the impact of HBOC from a male’s perspective with particular focus on your communication of family history and genetic test information with family members and health care providers. Our goal is to help genetic counselors and other health care providers better understand the needs of males affected by HBOC, so that we may provide better care and support for this population. The principal investigator of this study is Leigha Senter-Jamieson, MS, LGC, Associate Professor – Clinical Internal Medicine at The Ohio State University.

Participation in this study is voluntary and you may decline answering any questions or discontinue the interview at any time. There are no foreseeable risks involved in taking part in this study. All study data is reported as group data and individuals will not be identifiable. Additionally, this data could be presented in a medical journal and at internal and external conferences.

If you are interested in participating in this study or have questions please contact genetic counseling graduate student, Alexandra Suttman, by email or phone. If contacting by email, please include your name, phone number, and the best day/time to reach you.

We thank you in advance for your interest in participating in this study!
